

Sway – Get started

Description

The interface of Sway is based on the principle of “drag and drop” and aims to allow a user to add to its web panel varied content (videos, maps, tweets, interactive graphics, graphics and GIF files, etc.) stored in OneDrive, Bing, YouTube, Twitter, Facebook etc. Sway suggests search results on images, videos, tweets that could possibly be introduced into the existing composition. Sway also aims to allow a web integration with a simple code generated from the application to insert on a web page to share its presentations, which automatically adapt to different screen sizes (computers, tablets, phones).
