

Scrum Product Owner (PSPO)

Description

We train you for the role of Scrum Product Owner

Scrum is the most widely used agile project management methodology and is frequently employed by IT development teams. This method encourages teams to experiment and organize themselves independently to solve a problem. Teams continuously improve through regular reviews. This 2-day course equips you with the skills and knowledge of a Scrum Product Owner to effectively engage your teams and deliver the product that meets your expectations.

We prepare you for the PSPO exam

This course guides and prepares you to successfully pass the official exam: PSPO Certification, the cost of which is included in this training. This exam certifies your understanding of the various concepts related to this methodology.

Course Content

Module 1: Introduction

- Introduce the instructor, the class, complexity and Scrum

Module 2: Value-Driven Development

- The primary job of a product manager is to increase the value created by the product for which he or she is responsible. This section covers value drivers, and strategies for measuring them

Module 3: Product Management

- Agile product management is different than traditional approaches. This section explores those differences

Module 4: Plan a Release

- A release is often the first step to realizing value. What better way to learn how to plan a release than to do it? Here participants cover the basics of identifying a release goal and requirements, prioritization, estimation, adjustment, and baseline planning

Module 5: Managing Requirements

- The Product Backlog is the fuel that feeds the development team, and managing it is one of the primary roles of the Scrum Product Owner. Here you will learn about User Stories, prioritization and organization strategies, and Product Backlog grooming

Module 6: Release Planning

- What does a good release look like? What impact can a bad release have? This section explores release strategies and how to optimize the delivery of value with them

Module 7: Managing Releases

- Here we discuss how to manage the development of a release in the most cost-effective, Agile way possible to meet commitments and maximize ROI. Participants also learn how to adapt to realities that emerge during the development of a release

Module 8: Managing Products

- Total Cost of Ownership is fundamental to successfully managing a product. How do you balance between optimizing the value of a release and maximizing the value of the product or system as an asset for the organization?

Module 9: Scaling

- Understand how to apply all of the above learning in a multi-product, distributed, large organization that supports many customers and users with contractual service level agreements

Documentation

- Courseware included
